

What is claimed is:

1. A method for generating a facsimile of an image comprising the steps of:

generating signals representative of a particular shape;

arranging said signals into a field matrix of a plurality of pixel signals representative of location of at least some points of the image field;

providing an array of electro-optical devices each transformable between a first condition and a different second condition in response to electromagnetic stimulation; and

using said pixel signals to stimulate the devices in said array to generate at said array a facsimile of said selected image.
